

Ah, my apologies! I completely misread the setup. I see what happened now—you aren't the one trying to fix a broken bot on Railway; you're the infrastructure partner being handed a warm lead who *is* having that problem, and you want to swoop in, solve it, and sell them a premium, dedicated commercial RPC/Block Manager endpoint.

Given your footprint (running a third of the network), you already know the massive throughput and ultra-low latency Acki Nacki demands.

Here is how you can rapidly structure and price this new commercial service to capture this market.

1. The Value Proposition (The "Hook")

The client is currently losing money/uptime because public Cloudflare WAF layers treat public cloud providers (like Railway) as botnets. Your pitch to them is simple:

"Stop fighting Cloudflare and shared endpoints. We provide dedicated, unthrottled, high-throughput RPC endpoints straight into the core Block Keeper network with guaranteed whitelisting."

2. Commercial Pricing Framework

Because Acki Nacki requires massive parallelization (up to 250 threads) and sub-second finality, pricing purely by "number of requests" (like standard Infura or Alchemy models) can be risky due to unpredictable bandwidth costs.

Instead, a **Tiered Subscription + Dedicated Egress Buffer** model works best for commercial node services at this scale.

Tier 1: The Active Miner / Small Bot Team

- **Target:** Individual premium miners, small syndicates running highly active bots.
- **Suggested Price:** \$250 – \$500 / month
- **What they get:**
 - Access to a shared, high-availability commercial endpoint (isolated from the public mainnet.ackinacki.org traffic).
 - IP/Domain whitelisting on your load balancers.
 - Up to 1–2 TB of data egress included.
 - Max rate limit: e.g., 50–100 requests per second (RPS).

Tier 2: Premium Commercial / Mini-App Scale (Your Prospect)

- **Target:** Commercial "Node-as-a-Service" apps, Telegram Mini-Apps with a user base, or heavy automated mining operations.
- **Suggested Price:** \$1,500 – \$3,000 / month
- **What they get:**
 - **Dedicated RPC endpoint URL** mapping directly to your bare-metal infrastructure.
 - No Cloudflare WAF friction; direct custom firewall rules tailored to their Railway/cloud IP ranges.
 - 5–10 TB of monthly data egress.
 - High concurrency limits (200+ RPS sustained, bursting higher).

- 99.9% uptime SLA.

Tier 3: Enterprise / Custom Whitelabel

- **Target:** Large institutional staking operations or massive scale user platforms.
- **Suggested Price:** \$5,000+ / month (or a % of mining yield/rewards split)

3. Cost-Plus Buffer Checklist (Pronto Pricing)

To finalize your quote to them *today*, make sure you calculate your hard costs using this quick formula:

Price = (Compute + Bandwidth + Support) \times Premium \times Multiplier

1. **Bandwidth is the wild card:** Acki Nacki can push **1 Gbps to 2.5 Gbps full-duplex**. If this client's bots are incredibly chatty, they could burn through terabytes of data. Ensure your contract explicitly states: *"\$X per TB overaged beyond the allocated monthly tier."* (e.g., \$10–\$20 per extra TB depending on your provider).
2. **Dedicated IP Allocation:** Factor in the minor cost of spinning up dedicated proxy IPs or clean routing paths specifically for their Railway cluster traffic.

4. How to respond to win the deal

Since this was forwarded to you, you can respond to your partner or directly to the client with a highly consultative closing pitch:

"Hey [Name], I reviewed the diagnostic logs from your Railway bot. The MINER_ENDPOINT_FAILED,205 error is happening because the public endpoints are heavily protected by WAF rules designed to prioritize retail mobile traffic and block public cloud data centers (like Railway's IP ranges). Trying to tweak headers or switch to IPv6 won't reliably fix this long-term.

As an infrastructure partner running a major portion of the Acki Nacki network, we can spin up a **dedicated, high-throughput commercial RPC node** for your operation. This completely bypasses the public Cloudflare limitations, gives you direct, unthrottled access to our core Block Keepers, and guarantees uptime for your miners.

We can offer a dedicated commercial slot for **\$X,XXX/month** including [Y] TB of high-speed data egress, and can have your endpoints live and whitelisted today. Let me know if you want to test connectivity."

This immediately positions you as the expert who understands *exactly* why they are failing, while providing the only robust, production-grade solution.
